Comprehensive guide to research establishments in Western and Eastern Europe, as well as all international bodies with headquarters in Europe. Arranged by countries in alphabetical order. Organizations (except industrial firms) and place names are given in English. Index of original language titles, Index of English language titles, and Index of key-word subjects.

Fundamentals of Chemistry theme in two volumes, is a component of Encyclopedia of Chemical Sciences, Engineering and Technology Resources in the global Encyclopedia of Life Support Systems (EOLSS), which is an integrated compendium of twenty one Encyclopedias. The Theme is organized into six different topics which represent the main scientific areas : History and Fundamentals of Chemistry; Chemical Experimentation and Instrumentation; Theoretical Approach to Chemistry; Chemical Thermodynamics; Rates of Chemical Reactions; Chemical Synthesis of Substances. These two volumes are aimed at the following five major target audiences: University and College students Educators, Professional practitioners, Research personnel and Policy analysts, managers, and decision makers and NGOs

In the last decade, much progress has been made in these materials. This book presents a highly coherent coverage of supramolecular, photosensitive and electroactive materials, namely those that have been extensively investigated for applications in fields of electronic and photonic technologies. This extensive reference provides broad coverage of on different types of materials, their processing, spectroscopic characterization, physical properties and device applications. The implications reach from molecular recognition in synthetic and natural complexes to exciting new applications in chemical technologies, materials, nanostructures, functional materials, new generation catalysts, signal transducers, medical and biomedical applications and novel separation techniques. All these applications rely on supramolecular properties such as molecular recognition, molecular information, and tailored molecular assemblies. This book is aimed to present a highly coherent coverage of supramolecular, photosensitive and electroactive materials and their applications in electronic and photonic technologies. The research behind these materials constitute some of the most actively pursued fields of science. Key Features * Covers supramolecular photosensitive and electroactive materials * Provides recent developments on metallophthalocyanines and polydiacetylenes * Include various types of supramolecular materials, their processing, fabrication, physical properties and device applications * Role of polyimides in microelectronic and tribology * Describes Photosynthetic and respiratory proteins, Dendrimers * A very special topic presented in a timely manner and in a format

First multi-year cumulation covers six years: 1965-70.

The latest volume in this respected series encompasses subjects as diverse as materials with optical or biological properties, chiral molecules, advanced physical methods in organic synthesis and non-classical synthetic methodologies. Critical surveys are presented on: total synthesis of natural products; organometallic compounds in organic synthesis; the introduction and transformation of functional groups; and solid supported synthesis. The accompanying CD-ROM provides pdf files of the articles included in the book. This volume will be an invaluable reference source for students and researchers in both academia and industry.
